Patent No. 6274362

GENERAL INFORMATION:

APPLICANT: Hodge, Martin R.

TITLE OF INVENTION: RGS-Containing Molecules and Uses Thereof

FILE REFERENCE: 5800-19, 035800/174680

CURRENT APPLICATION UNDER: US/09/244,314

CURRENT FILING DATE: 1999-02-04

NUMBER OF SEQ ID NOS: 4

SOFTWARE: Patentin Ver. 2.0

SEQ ID NO. 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1, Sequence 6, Sequence 6, Sequence 6, Sequence 2, Sequen

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 2, Application US/08461379A
Patent No. 5871961
Patent No. 5871961
GENERAL INFORMATION:
APPLICANT: Smith, Kendall A. & Beadling, Carol
APPLICANT: Smith, Kendall A. & Beadling, Carol
TITLE OF INVENTION: Walcleic Acids Encoding CRS Polypeptide,
TITLE OF INVENTION: Vector and Transformed Cell Thereof, and
TITLE OF INVENTION: Expression Thereof
NUMBER OF SEQUENCES: 35
CORRESPONDENCE ADDRESS:

                                                                                          mouse embryo implantation.";
Submitted (OCT-2001) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: INHIBITS SIGNAL TRANSDUCTION BY INCREASING THE GTPASE
ACTIVITY OF G PROTEIN ALPHA SUBUNITS THEREBY DRIVING THEM INTO
THEIR INACTIVE GDP-BOUND FORM. MAY PLAY A ROLE IN LEUKEMOGENESIS.
-!- TISSUE SPECIFICITY: Expressed in a wide variety of tissues.
-!- PTM: Phosphorylated by protein kinase C (By similarity).
-!- SIMILARITY: Contains 1 RGS domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

FUNCTION: INHIBITS SIGNAL TRANSDUCTION BY INCREASING THE GTPASE FUNCTION: INHIBITS SIGNAL TRANSDUCTION BY INCREASING THE GTPASE FUNCTION: OF G PROTEIN ALPHA SUBUNITS THEREBY DRIVING THEM INTO THEM INTO THE GDP-BOUND FORM. ACTIVITY ON G(2)-ALPHA IS INHIBITED BY PHOSPHORYLATION OF THE G-PROTEIN. ACTIVITY ON G(2)-ALPHA AND G(1)-ALPHA-1 IS INHIBITED BY PALMITOYLATION OF THE G-PROTEIN. PTM: Either Cys-2 or Cys-12 or both are palmitoylated (By similarity).
FYM: Either Cys-2 or Cys-12 of Both are palmitoylated (By Similarity).
FYM: Either Cys-2 or Cys-12 of Both are palmitoylated (By Similarity).
              other RGS proteins by palmitoylation

Submitted (AUG-2000) to the EMBL/GenBank/DDBJ databases.
-!-FUNCTION: INHIBITS SIGNAL TRANSDUCTION BY INCREASING THE GTPASE
ACTIVITY OF G PROTEIN ALPHA SUBUNITS THEREBY DRIVING THEM INTO
THEIR INACTIVE GDP-BOUND FORM. PREFERENTIALLY BINDS TO G(0)-ALPHA
AND G(1)-ALPHA-3 (BY SIMILARITY).
                                                                                                                                                                                                                                                             Signal transduction inhibitor, Alternative splicing, Phosphorylation DOMAIN 394 510

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 Clone distribution: MGC clone distribution information can be found through the I.M.A.G.E. Consortium/LLNL at: http://image.llnl.gov Series: IRL Plate: 37 Row: d Column: 18
This clone was selected for full length sequencing because it passed the following selection criteria: matched mRNA gi: 18640749.

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

sequences. The C-terminal location of the RGS domain is consistent with RGSs known to act as GTPase activating proteins (GAPs) for G-alpha proteins. G-alpha-i linked receptors support rapid adheasion and directed migration of leukocytes and other cell types. The novel RGS proteins may be used to modulate cell adhesion and chemotaxis, e.g. for aiding wound repair. The RGS proteins, related cDNAs and anti-RGS antibodies are useful for modulation, diagnosis and treatment of immune and respiratory

encoded by homologous DNA sequences. The invention is useful for its identifying an agent that binds to human or mouse RGS protein or its variant, or RGS protein encoded by homologous DNA sequences, or a host cell expressing the RGS protein or its variant, or RGS protein encoded by homologous DNA sequences. The agents identified using the invention are useful for modulating the activity of RGS proteins and thus useful for treating immune and inflammatory disorders (Grave's disease, allergy, arthritis), respiratory disorders (asthma, pneumonia, sinusitis), haematological disorders (haematopolesis, migration), platelet-associated disorders (thrombocytopaenia), invasive disorders (leukaemia), erythrocyte-associated disorders (anaemia), pancreatitis, hepatitis etc.

The present invention relates to the isolation of polymucleotide sequences, that encode a novel regulator of g protein signalling (RGS) polypeptide, RGS18, from human platelets. The invention also provides nucleotide primers and probes specific for an RGS18 nucleic acid. The sequences of the invention are useful for the manufacture of a medicament for the prevention or treatment of a platelet activation dysfunction, and as atterial thrombosis, myocardial infarction, coronary artery disease, stroke, cerebrovascular disease, unstable angina, deep vein thrombosis, systemic thromboembolism, and in invasive cardiac procedures for anti-coagulant purposes. The sequences of the invention can also be used for the detection of RGS18 nucleic acids and RGS18 polypeptides. The present sequence represents 5'-RACE clone DNA used to generate the full length human RGS18 cDNA

The RGS (regulators of G-protein signaling) protein genes, clones AAH16355 and m1975, were identified in human and murine spleen cDNA libraries, respectively. Both proteins have unique N- and C-terminal sequences. The C-terminal location of the RGS domain is consistent with RGSS known to act as GTPase activating proteins (GAPs) for G-alpha proteins. G-alpha-i linked receptors support rapid adhesion and directed migration of leukocytes and other cell types. The novel RGS proteins may be used to modulate cell adhesion and chemotaxis, e.g. for aiding wound repair. The RGS proteins, related CDNAs and anti-RGS antibodies are useful for modulation, diagnosis and treatment of immune and respiratory

The invention relates to screening assays for identifying an agent that binds to: human or mouse RGS (regulators of G-protein signalling) protein or treative variant, or RGS protein encoded by homologous DNA sequences; or a concided by homologous DNA sequences. The invention is useful for identifying an agent that binds to human or mouse RGS protein or its variant, or RGS protein are cell expressing the RGS protein or its variant, or RGS protein encoded by homologous DNA sequences. The agents identified using the invention are useful for modulating the activity of RGS proteins and thus useful for treating immune and inflammatory disorders (Grave's disease, allergy, arthritis), respiratory disorders (asthma, pneumonia, sinusitis), has acciated disorders (langerial leibraemia), invasive disorders (leukaemia), erythrocyte-associated disorders (anaemia), pancreatitis, hepatitis etc. The present sequence is human RGS protein, h16395 cDNA

The present invention relates to novel human ORFX polypeptides and their coding sequences (ABP63631-ABP64681 and ABQ98194-ABQ99267). The sequences were discovered in human atherogenic cells, in particular in platelets and human umbilical vein endothelial cells (HUVBC) and are expressed in many other tissues as well. Atlerogenic cells are cells which have the potential to develop atherosclerotic plaques. The ORFX polypeptides and nucleic acids are useful for treating or preventing a pathological condition associated with an ORFX-associated disorder, e.g. cancer, cardiovascular disease, allergy, autoimmune disease, wound healing, blood sogulation disorders or inflammatory disorders. Note: The sequence data for this patent did not form part of the printed specification, but was sequence in electronic format directly from the USPTO web site at sequence.

The invention relates to a novel array comprising at least two isolated nucleotide molecules and molecule having a sequence capable of uniquely hybridising to a nucleic acid molecule which is an expression product of a gene involved in mitochondrial biology. The array comprises two or more isolated nucleic acid molecules or spots, each molecule having a sequence chosen from sequence of 994 human probes and 2046 mouse probes. An array of the invention is useful for determining an expression profile of a mouse or human sample containing nucleic acid, by contacting the array of the invention is useful for determining an expression profile of a mouse or human sample under conditions allowing selective hybridisation, and measuring hybridisation of nucleic acid in the sample to the array to produce an expression profile. The array is also useful for determining an expression profile of a first labelled sample containing nucleic acid. The second sample is a reference or a standard. An array is useful containing mitochondrial biology gene expression profiles of an energy-metabolism determining mitochondrial biology gene expression profiles of calcentions of calcenting mitochondrial biology gene expression profiles of organisms.

The present invention relates to methods of diagnosing breast cancer in a patient, which comprise detecting the level of expression in a tissue sample of two or more genes selected from those shown in ABTO9667-
ample of two or more genes selected from those shown in ABTO9667-
ABT11112, where a differential expression of the genes indicates breast cancer. The methods are useful in diagnosing, treating, detecting the progression, and in monitoring treatment of breast cancer in patients.

The methods are also useful as a screening tool for agents that modulate the onset or progression of breast cancer. The breast cancer genes may be med as diagnostic markers for the prediction or identification of the malignant state of breast tissue, for confirming the type and progression of cancer, and for drug screening and assays. The present sequence is a coding sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from Wibo at

Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and drug toxicity. Detecting granulocyte activation by detecting genes associated with granulocyte activation.

Claim 1; SEQ ID NO 405; 114pp; English

The invention relates to detecting (M1) granulocyte (GC) activation (GCA), by detecting the level of expression of gene(s) (GS) identified by DNA chip analysis as given in the specification, and comparing the expression level to an expression level in an unactivated GC, where differential expression of GS is indicative of GCA. Also included are modulating (M2) GA by contacting GC with an agent that alters the modulating GCA or an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the gene expression of profile; (3) detecting (M4) an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the level of expression in a sample of the tissue of gene(s) from Gs, where the level of expression of the gene is indicative of inflammation; (4) treating (MS) an inflammation (especially chronic) or in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammation (especially chronic) or in a tissue, an allergic response in a subject, expression of gene(s) from GS in the tissue M1 genetial for detecting GCA; M2 is useful for modulating GA, M3 is useful for detecting an agent capable of modulating GA preferably in an inflammation in a tissue, M is useful for detecting an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammation disease, syndrome, inflammatory disease, contacting an inflammation disease, useful for detecting an inflammation disease, useful for detecting inflammation in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammation disease, useful for detecting for the addition, presented for the disease, also b conditions. The present sequence represents a gene differentially expressed in granulocytes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at from youly, published\_pot\_sequences

Sequence 1345 BP; 443 A; 254 C; 304 G; 344 T; 0 U; 0 Other;

The present invention describes a method for predicting, diagnosing or programs or angular disease by detecting a chronic obstructive pulmonary disease (COPD) gene related polymucleotide (see ACC46750 to ACC46777, which encode the COPD related proteins in ABP96779 to

ABP96806). The method is useful for predicting, diagnosing or prognosing cronnic lung disease in a biological sample. The COPD genes and proteins encoded by them from the present invention (I) can be used for treating or preventing chronic lung disease in a mammal. (I) can be used in an animal model for determining the efficacy, toxicitry, or side effects of treatment with (I), and determining the mechanism of action of (I). ACC46778 to ACC46903 represent COPD related PCR primers and probes used

The invention relates to a combination which, comprises a number of polynucleotide probes comprising a sequence selected from one of the 1490 sequences mentioned in the specification. The combination is useful as an array element in a microarray for monitoring the expression of a number of dargnostis and treatment of cancer and immunopathology and neuropathology. The microarray is useful in diagnostics and treatment regimens, drug discovery and development, toxicological and carcinogenicity studies, of premists and paramacogenomics. The microarray is also useful for monitoring progression of diseases and for developing sophisticated profiles for the effects of currently available therapeutic drugs. The combination is also useful for purifying a subpopulation of mankas, only and genomic fragments and in research and diagnostic applications. The array can detect changes in expression in a large number of genes coding carray can detect changes in expression in a large number of genes coding various diseases including cancer e.g. adenocarcinoma and leukaemia, immunopathies e.g. AIDS and asthma, neuropathies e.g. Alzheimer's disease and Parkinson's disease. The present sequence represents a polyvucleotide probe of the invention. Note: The sequence after for this patent did not form part of the printed specification but was obtained in electronic format directly from USTO at this patent did not format directly and processing a polymer of the printed specification but was obtained in electronic

fnote="Corgan: liver; Vector: pDNR-LIB (Clontech); Site_1:
Sfil (ggccgcctcggcc); Site_2: Sfil (ggccattatggcc); 5' and
3' adaptors were used in cloning as follows: 5' adaptor
sequence: 5'-CACGGCGATTATGGCC-3' and 3' adaptor sequence:
5'-ATTCTAGAGCCGAGGCGGATG-41(30)Bn-3' (where B = A,
C, or G and N = A, C, G, or T). Average insert size 1:8kb (range 1:0-4:0 kb): 15/15 colonies contained inserts
by PCR. This library was enriched for full-length clones
and was constructed by Clontech Laboratories (Palo Alto,
CA). Note: this is a NIH_MGC Library."

The RGS (regulators of G-protein signaling) protein genes, clones AAH16395 and m1975, were identified in human and murine spleen cDNA libraries, respectively. Both proteins have unique N- and C-terminal sequences. The C-terminal location of the RGS domain is consistent with RGSs known to act as Grease activating proteins (GAPs) for G-alpha proteins. G-alpha-i linked receptors support rapid adhesion and directed migration of leukoytes and other cell types. The novel RGS proteins may be used to modulate cell adhesion and chemotaxis, e.g. for aiding wound repair. The RGS proteins, related cDNAs and anti-RGS antibodies are
 for modulation, diagnosis and treatment of immune and respiratory
 Novel regulator of G-protein signaling nucleic acids and polypeptides, useful as diagnostic and investigative tools and to treat G-protein

The invention relates to screening assays for identifying an agent that binds to: human or mouse RGS (regulators of G-protein signalling) protein or test avariant, or RGS protein encoded by homologous DNA sequences; or a cooded by homologous DNA sequences. The invention is useful for identifying an agent that binds to human or mouse RGS protein or its variant, or RGS protein and one of the agents identified using the invention are useful for modulating the activity of RGS proteins and thus useful for treating immune and inflammatory disorders (Grave's disease, allergy, arthritis), respiratory disorders (asthma, pneumonia, sinusitis), hammatological disorders (haematopolesis, migration), platelet-associated disorders (anaemia), pancreatitis, hepatitis etc. The present sequence is murine RGS protein, m1975

 The present invention relates to the isolation of polynucleotide sequences, that encode a novel regulator of g protein signalling (RGS) polypeptide, RGS18, from human platelets. The invention also provides nucleotide primers and probes specific for an RGS18 nucleic acid. The sequences of the invention are useful for the manufacture of a medicament for the prevention or treatment of a platelet activation dysfunction, and as arrerial thrombosis, myocardial infarction, coronary aftery disease, stroke, cerebrovascular disease, unstable angina, deep vein thrombosis, systemic thromboembolism, and in invasive cardiac procedures for anti-coagulant purposes. The sequences of the invention can also be used for the detection of RGS18 nucleic acids and RGS18 polypeptides. The platelets

 The present invention relates to novel human coding sequences (ABQ99268-ABQ99608) and proteins (ABP64682-ABP65022). The sequences are useful in therapeutic, diagnostic and research methods. The polynucleotides may be used in the field of molecular blology as hybridisation probes, primers for PCR, for chromosome and gene mapping, for the recombinant production of protein, or in generation of anti-sense DNA or RNA. The polynucleotides are useful in diagnostics as expressed sequence tags

current genome. The proteins may be used as molecular weight markers, or as nutritional sources or supplements. The proteins may be used as molecular weight markers, or an untritional sources or supplements. The proteins may be used to maintain and expand cell population in a totipotential or pluripotential state (useful for the engineering damaged or diseased tissues, transplantation, manufacture of bio-pharmaceuticals or the development of bio-sensors. The polymucleotides and proteins are useful for preventing, treating or ameliorating disorders involving aberrant protein expression or biological activity, e.g. haematopoietic disorders, central/peripheral nervous system diseases, mechanical and traumatic disorders, non-healing wounds, immune deficiencies and disorders, infectious diseases caused by viral, bacterial or fungal infection, autoimmune disorders, allergic reactions and conditions, coagulation disorders, or cancer. The polymucleotide sequences of the invention were assembled from Este isolated mainly by sequencing by hybridisation, and in some cases, sequences obtained from one or more public databases. Note: The sequence of the print of the printed specification, but was obtained in electronic format directly from WIPO at circle property or sequences.

The present invention relates to novel human ORFX polypeptides and their coding sequences (ABP63631-ABP64681 and ABQ98194-ABQ99267). The sequences were discovered in human acherogenic cells, in particular in platelets and human umbilical vein endothelial cells (HUVBC) and are expressed in many other tissues as well. Atherogenic cells are cells which have the potential to develop atherosclerotic plaques. The ORFX polypeptides and nucleic acids are useful for treating or preventing a pathological condition associated with an ORFX-associated disorder, e.g. cancer, cardiovascular disease, allergy, autoimmune disease, wound healing, blood cosquiation disorders or infilammatory disorders. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site at sequence.

120
 Predicting, diagnosing or prognosing chronic lung disease, by detecting a chronic obstructive pulmonary disease (COPD) gene in a biological sample.
 117
 DFKKCKEPQQIILKAKAIYEKFIQNDAPKEVNIDFHTKEVIAKSIAQPTLHSFDTAQSRV 180
 The present invention describes a method for predicting, diagnosing or prognosing chronic lung disease by detecting a chronic obstructive pulmonary disease (COPD) gene related polymolecuide (see ACC46750 to ACC46777, which encode the COPD related proteins in ABP96779 to ABP96806). The method is useful for predicting, diagnosing or prognosing chronic lung disease in a biological sample. The COPD genes and proteins encoded by them from the present invention (I) can be used for treating or preventing chronic lung disease in a mammal. (I) can be used in an animal model for determining the efficacy, toxicity, or side effects of treatment with (I), and determining the mechanism of action of (I). ACC46778 to ACC46031 represent COPD related PCR primers and probes used in an example from the present invention

 The present sequence is a human regulator polypeptide of G-protein signaling (RGS) 2. The RGS gene is located on chromosome 1. The RGS polynucleotide and polypeptide are useful for identifying test compounds, that may act as agonists or antagonists at the receptor site and which can be regulated to provide therapeutic effects. The polynucleotide, polypeptide or vectors comprising the polynucleotide, and the reagents are useful for modulating the activity of RGS in a disease, particularly in asthma or diabetes

The present sequence represents human regulator of G-protein signalling (HRGS). The HRGS regulates G-protein signalling in cancer cells and may be useful in the treatment of any cancer, especially cancers of the brain and thyroid. Products of the present invention can also be used for treating other conditions associated with uncontrolled cell signalling such as inflammation. The products can also be used to modulate HRGS activity in response to disorders involving the sympathetic nervous system including hypertension, cardiovascular shock, arrhythmias and asthma. The products can also be used for detection, diagnosis and drug

 The present sequence represents a regulator of G protein signalling (AGS) protein, RGS5. The specification also describes an activator of G protein signalling (AGS) protein. The AGS protein exhibits homology to ras-related from a human liver cDNA library. The AGS protein exhibits homology to ras-related G proteins, and contains alterations in conserved amino acids consistent with a deficiency in GFP hydrolysis activity. AGS stimulates G protein activity, G protein-coupled signal transduction and the pheromone response pathway in a receptor-independent manner. The AGS protein also shows 6-gamma selectivity, as measured by growth assays in yeast expression, as measured by Northern blot analysis. The AGS protein can be used to screen for compounds that modulate cellular signal transduction. The protein is used to treat disorders characterized by an aberrant AGS protein activity or AGS nucleic acid expression
